Introduction to Artificial Intelligence

Acknowledgement

- The slides of this lecture have been taken from the lecture slides of CS307 – "Introduction to Artificial Intelligence" and CSE652 – "Knowledge Discovery and Data mining" by Dr. Sajjad Haider.

Course Outline

- Overview of Artificial Intelligence ✔
- State Space Representation ✔
- Search Techniques ✔
- AI in Adversarial Games ✔
- **Machine Learning**
- Propositional and Predicate Logic
- Probabilistic Reasoning
- Introduction to Robots
- Computer Vision
- Natural Language Processing
- Reinforcement Learning

Machine Learning

- As a broad subfield of artificial intelligence, machine learning is concerned with the **design and development of algorithms and techniques that allow computers to "learn".**
- A major focus of machine learning research is to automatically learn to recognize complex patterns and make intelligent decisions based on data.

Types of Learning

- Supervised Learning
  - Classification
  - Regression
- Unsupervised Learning
- Reinforcement Learning

* The focus in this course in on Classification techniques

Popular Machine Learning Techniques

- Classification
  - Classification Trees
  - Naïve Bayes
  - Artificial Neural Networks
- Clustering
  - K-Means
- Reinforcement Learning*

Classification Example

Venue	Type of Wicket	Type of match	Batted first	Winning Team
Pakistan	Slow	ODI	Pakistan	Pakistan
India	Fast	Test	Pakistan	Pakistan
India	Slow	ODI	India	India
Pakistan	Slow	ODI	Pakistan	India
Third country	Fast	ODI	India	Pakistan
India	Fast	ODI	India	India
Pakistan	Fast	Test	India	Pakistan
Third country	Fast	Test	Pakistan	India
Third country	Slow	Test	India	Pakistan
Third country	Slow	ODI	Pakistan	Pakistan
Pakistan	Fast	ODI	Pakistan	India
Third country	Slow	Test	Pakistan	Pakistan
Pakistan	Fast	ODI	India	Pakistan
Third country	Fast	Test	Pakistan	India
India	**Slow**	**ODI**	**Pakistan**	**???**

Classification

- Given a collection of records (*training set*)
  - Each record contains a set of *attributes*, one of the attributes is the *class (categorical variable)*.
- Find a *model* for class attribute as a function of the values of other attributes (supervised learning).

Venue	Type of Wicket	Type of match	Batted first	Winning Team
Pakistan	Slow	ODI	Pakistan	Pakistan
India	Fast	Test	Pakistan	Pakistan
India	Slow	ODI	India	India
Pakistan	Slow	ODI	Pakistan	India
Third country	Fast	ODI	India	Pakistan
India	Fast	ODI	India	India
Pakistan	Fast	Test	India	Pakistan
Third country	Fast	Test	Pakistan	India
Third country	Slow	Test	India	Pakistan
Third country	Slow	ODI	Pakistan	Pakistan
Pakistan	Fast	ODI	Pakistan	India
Third country	Slow	Test	Pakistan	Pakistan
Pakistan	Fast	ODI	India	Pakistan
Third country	Fast	Test	Pakistan	India
India	**Slow**	**ODI**	**Pakistan**	**???**

Classification

- Goal: previously unseen records should be assigned a class as accurately as possible.
  - A *test set* is used to determine the accuracy of the model. Usually, the given data set is divided into training and test sets, with training set used to build the model and test set used to validate it.

Application of Classification

- E-mail Classification (Spam vs. Inbox)
- Intrusion Detection
- Credit Scoring
  - Loan Defaulter
  - Fraud Detection
- Biometric Identification
  - Fingerprinting
  - Handwriting
  - Speech Recognition
- Search Engines

An Example application

- A credit card company typically receives thousands of applications for new cards. The application contains information regarding several different attributes, such as annual salary, any outstanding debts, age etc. The problem is to categorize applications into those who have good credit, bad credit, or fall into a gray area (thus requiring further human analysis).

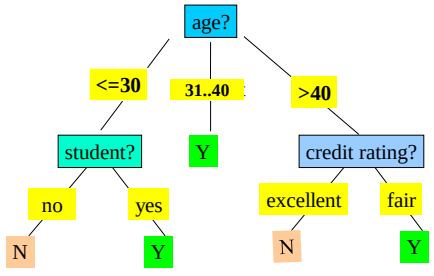
Another Application

- An emergency room in a hospital measures 17 variables (e.g., blood pressure, age, etc) of newly admitted patients. A decision has to be taken whether to put the patient in an intensive-care unit. Due to the high cost of ICU, those patients who may survive less than a month are given higher priority. The problem is to predict high-risk patients and discriminate them from low-risk patients.

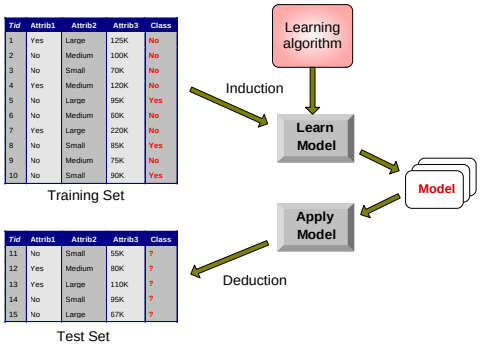
Classification Example

age	income	student	credit_rating	buys_computer
<=30	high	no	fair	no
<=30	high	no	excellent	no
31…40	high	no	fair	yes
>40	medium	no	fair	yes
>40	low	yes	fair	yes
>40	low	yes	excellent	no
31…40	low	yes	excellent	yes
<=30	medium	no	fair	no
<=30	low	yes	fair	yes
>40	medium	yes	fair	yes
<=30	medium	yes	excellent	yes
31…40	medium	no	excellent	yes
31…40	high	yes	fair	yes
>40	medium	no	excellent	no

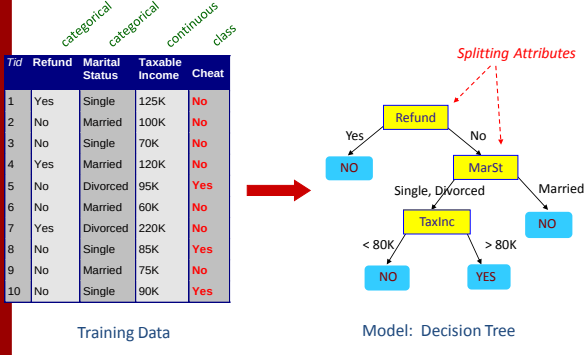
Classification Tree



Illustrating Classification Task

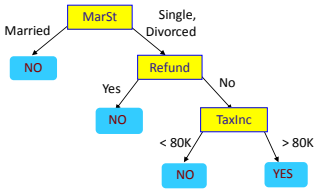


Example of a Decision Tree



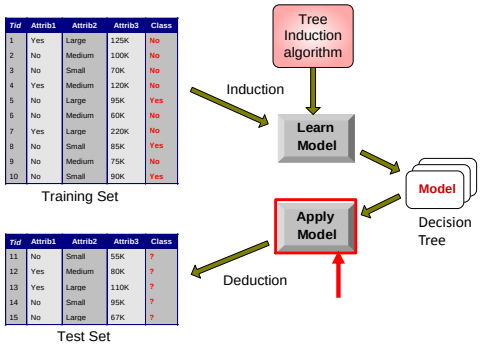
Another Example of Decision Tree

Tid	Refund	Marital Status	Taxable Income	Cheat
	categorical	categorical	continuous	class
1	Yes	Single	125K	No
2	No	Married	100K	No
3	No	Single	70K	No
4	Yes	Married	120K	No
5	No	Divorced	95K	Yes
6	No	Married	60K	No
7	Yes	Divorced	220K	No
8	No	Single	85K	Yes
9	No	Married	75K	No
10	No	Single	90K	Yes



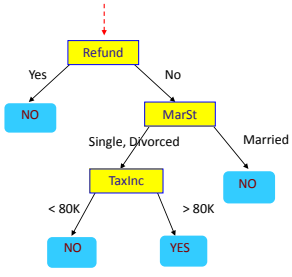
There could be more than one tree that fits the same data!

Decision Tree Classification Task



Apply Model to Test Data

Start from the root of tree.



Test Data

Refund	Marital Status	Taxable Income	Cheat
No	Married	80K	?

Apply Model to Test Data

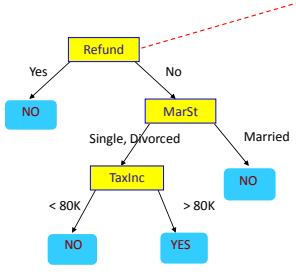
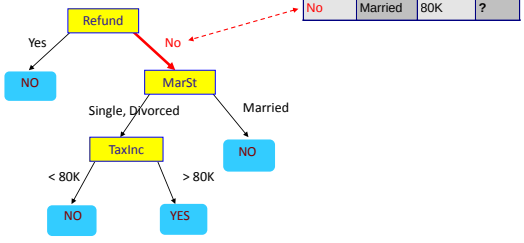
No	Married	80K	?



Apply Model to Test Data

Test Data

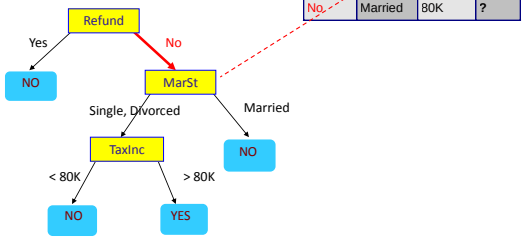
Refund	Marital Status	Taxable Income	Cheat
No	Married	80K	?



Apply Model to Test Data

Test Data

Refund	Marital Status	Taxable Income	Cheat
No	Married	80K	?



Apply Model to Test Data

Test Data

Refund	Marital Status	Taxable Income	Cheat
No	Married	80K	?

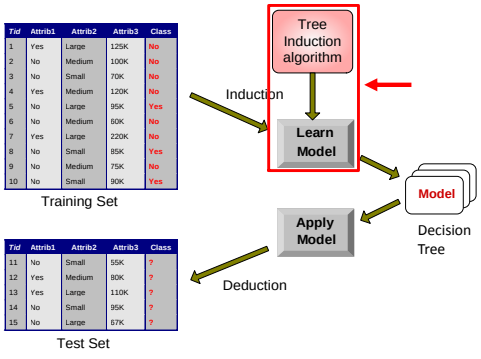
Decision Tree Classification Task



Tree Induction

- Greedy strategy.
  - Split the records based on an attribute test that optimizes certain criterion.
- Issues
  - Determine how to split the records
    - How to specify the attribute test condition?
    - How to determine the best split?
  - Determine when to stop splitting

How to Specify Test Condition?

- Depends on attribute types
  - Categorical
  - Numeric
    - Discrete
    - Continuous
- Depends on number of ways to split
  - 2-way split
  - Multi-way split

How to determine the Best Split

- Greedy approach:
  - Nodes with homogeneous class distribution are preferred
- Need a measure of node impurity:

C0: 5 C1: 5	C0: 9 C1: 1
Non-homogeneous,	**Homogeneous,**
High degree of impurity	**Low degree of impurity**

Measures of Node Impurity

- Gini Index

$$GINI(t) = 1 - \sum_j [p(j \mid t)]^2$$

- Entropy

$$Entropy(t) = -\sum_j p(j \mid t) \log p(j \mid t)$$

Measure of Impurity: GINI

- Gini Index for a given node t :

$$GINI(t) = 1 - \sum_j [p(j \mid t)]^2$$

(NOTE: *p(j | t)* is the relative frequency of class j at node t).

- Maximum (1 - $1/n_c$) when records are equally distributed among all classes, implying least interesting information
- Minimum (0.0) when all records belong to one class, implying most interesting information

C1	0
C2	6
Gini=0.000	

C1	1
C2	5
Gini=0.278	

C1	2
C2	4
Gini=0.444	

C1	3
C2	3
Gini=0.500	

Examples for computing GINI

$$GINI(t) = 1 - \sum_j [p(j \mid t)]^2$$

C1	0
C2	6

P(C1) = 0/6 = 0 P(C2) = 6/6 = 1

Gini = 1 – P(C1)² – P(C2)² = 1 – 0 – 1 = 0

C1	1
C2	5

P(C1) = 1/6 P(C2) = 5/6

Gini = 1 – (1/6)² – (5/6)² = 0.278

C1	2
C2	4

P(C1) = 2/6 P(C2) = 4/6

Gini = 1 – (2/6)² – (4/6)² = 0.444

age	income	student	credit_rating	buys_computer
<=30	high	no	fair	no
<=30	high	no	excellent	no
31…40	high	no	fair	yes
>40	medium	no	fair	yes
>40	low	yes	fair	yes
>40	low	yes	excellent	no
31…40	low	yes	excellent	yes
<=30	medium	no	fair	no
<=30	low	yes	fair	yes
>40	medium	yes	fair	yes
<=30	medium	yes	excellent	yes
31…40	medium	no	excellent	yes
31…40	high	yes	fair	yes
>40	medium	no	excellent	no

Binary Attributes: Computing GINI Index

- Splits into two partitions
- Effect of Weighing partitions:
  - Purer Partitions (having lower GINI index) are sought for.

	Buy Computer
Yes	9
No	5
Gini = 0.46	

Gini(N1)
= 1 – (6/7)² – (1/7)²
= 0.24

Gini(N2)
= 1 – (3/7)² – (4/7)²
= 0.49

	student yes	student no
Yes	6	3
No	1	4
Gini=0.365		

Gini(Student)
= 7/14 * 0.24 +
7/14 * 0.49
= ??

GINI Index for Buy Computer Example

- Gini (Income):
- Gini (Credit_Rating):
- Gini (Age):

Measure of Impurity: Entropy

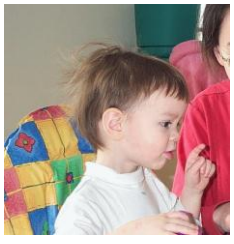
- Entropy at a given node t:

$$Entropy(t) = -\sum_j p(j \mid t) \log p(j \mid t)$$

(NOTE: $p(j \mid t)$ is the relative frequency of class j at node t).

  - Measures homogeneity of a node.
    - Maximum ($\log n_c$) when records are equally distributed among all classes implying least information
    - Minimum (0.0) when all records belong to one class, implying most information
  - Entropy based computations are similar to the GINI index computations

Entropy in a nut-shell



Low Entropy

High Entropy

Examples for computing Entropy

$$Entropy(t) = -\sum_j p(j \mid t) \log_2 p(j \mid t)$$

C1	0
C2	6

P(C1) = 0/6 = 0 P(C2) = 6/6 = 1

Entropy = – 0 log 0 – 1 log 1 = – 0 – 0 = 0

C1	1
C2	5

P(C1) = 1/6 P(C2) = 5/6

Entropy = – (1/6) $\log_2$ (1/6) – (5/6) $\log_2$ (5/6) = 0.65

C1	2
C2	4

P(C1) = 2/6 P(C2) = 4/6

Entropy = – (2/6) $\log_2$ (2/6) – (4/6) $\log_2$ (4/6) = 0.92

Inducing a decision tree

- There are many possible trees
- How to find the most compact one
  - that is consistent with the data?
- The *key* to building a decision tree - which attribute to choose in order to branch.
- The *heuristic* is to choose the attribute with the minimum GINI/Entropy.

Algorithm for Decision Tree Induction

- Basic algorithm (a greedy algorithm)
  - Tree is constructed in a top-down recursive manner
  - At start, all the training examples are at the root
  - Attributes are categorical
  - Examples are partitioned recursively based on selected attributes
  - Test attributes are selected on the basis of a heuristic or statistical measure (e.g., GINI/Entropy)
- Conditions for stopping partitioning
  - All examples for a given node belong to the same class
  - There are no remaining attributes for further partitioning – majority voting is employed for classifying the leaf
  - There are no examples left

Extracting Classification Rules from Trees

- Represent the knowledge in the form of IF-THEN rules
- One rule is created for each path from the root to a leaf
- Each attribute-value pair along a path forms a conjunction. The leaf node holds the class prediction
- Rules are easier for humans to understand
- Example

IF *age* = "<=30" AND *student* = "*no*" THEN *buys_computer* = "*no*"
IF *age* = "<=30" AND *student* = "*yes*" THEN *buys_computer* = "*yes*"
IF *age* = "31…40" THEN *buys_computer* = "*yes*"
IF *age* = ">40" AND *credit_rating* = "*excellent*" THEN *buys_computer* = "*yes*"
IF *age* = "<=30" AND *credit_rating* = "*fair*" THEN *buys_computer* = "*no*"

How to Estimated Classification Accuracy or Error Rates

- Partition: Training-and-testing
  - use two independent data sets, e.g., training set (2/3), test set(1/3)
  - used for data set with large number of exmples
- Cross-validation
  - divide the data set into *k* subsamples
  - use *k-1* subsamples as training data and one sub-sample as test data—*k*-fold cross-validation
  - for data set with moderate size

Decision Tree Based Classification

- Advantages:
  - Inexpensive to construct
  - Extremely fast at classifying unknown records
  - Easy to interpret for small-sized trees
  - Accuracy is comparable to other classification techniques for many simple data sets

Metrics for Performance Evaluation

- Focus on the predictive capability of a model
  - Rather than how fast it takes to classify or build models, scalability, etc.
- Confusion Matrix:

		PREDICTED CLASS	
		Class=Yes	Class=No
ACTUAL CLASS	Class=Yes	a	b
	Class=No	c	d

a: TP (true positive)
b: FN (false negative)
c: FP (false positive)
d: TN (true negative)

Metrics for Performance Evaluation…

		PREDICTED CLASS	
		Class=Yes	Class=No
ACTUAL CLASS	Class=Yes	a (TP)	b (FN)
	Class=No	c (FP)	d (TN)

- Most widely-used metric:

$$\text{Accuracy} = \frac{a+d}{a+b+c+d} = \frac{TP+TN}{TP+TN+FP+FN}$$

Limitation of Accuracy

- Consider a 2-class problem
  - Number of Class 0 examples = 9990
  - Number of Class 1 examples = 10
- If model predicts everything to be class 0, accuracy is 9990/10000 = 99.9 %
  - Accuracy is misleading because model does not detect any class 1 example

Cost Matrix

	PREDICTED CLASS		
	C(i|j)	**Class=Yes**	**Class=No**
ACTUAL CLASS	**Class=Yes**	C(Yes|Yes)	C(No|Yes)
	Class=No	C(Yes|No)	C(No|No)

C(i|j): Cost of misclassifying class j example as class i

Cost Matrix (Cont'd)

	PREDICTED CLASS		
ACTUAL CLASS		True	False
	True	10	5
	False	1	14

	PREDICTED CLASS		
ACTUAL CLASS		True	False
	True	10	3
	False	3	14

	PREDICTED CLASS		
ACTUAL CLASS		True	False
	True	10	6
	False	0	14

All three confusion matrices have the same accuracy value, i.e., **24 / 30**

What if the cost of misclassification is not the same for both type of errors?

Cost Matrix (Cont'd)

	PREDICTED CLASS		
ACTUAL CLASS		True	False
	True	10	5x5
	False	1	14

	PREDICTED CLASS		
ACTUAL CLASS		True	False
	True	10	3x5
	False	3	14

	PREDICTED CLASS		
ACTUAL CLASS		True	False
	True	10	6x5
	False	0	14

Suppose the cost of misclassifying True as False is 5 while the cost of misclassifying False as True is 1.

Accuracy values are: **24/50, 24/42, 24/54**

Cost Matrix (Cont'd)

		PREDICTED CLASS	
		True	False
ACTUAL CLASS	True	10	5x4
	False	1	14

		PREDICTED CLASS	
		True	False
ACTUAL CLASS	True	10	3x4
	False	3	14

		PREDICTED CLASS	
		True	False
ACTUAL CLASS	True	10	6x4
	False	0	14

Suppose the cost of misclassifying True as False is **4** while the cost of misclassifying False as True is 1.

Accuracy values are:
24/45, 24/39, 24/48

Cost-Sensitive Measures

$$\text{Precision (p)} = \frac{a}{a+c}$$

$$\text{Recall (r)} = \frac{a}{a+b}$$

$$\text{F-measure (F)} = \frac{2rp}{r+p} = \frac{2a}{2a+b+c}$$

- Precision is biased towards C(Yes|Yes) & C(Yes|No)
- Recall is biased towards C(Yes|Yes) & C(No|Yes)
- F-measure is biased towards all except C(No|No)

$$\text{Weighted Accuracy} = \frac{w_1 a + w_4 d}{w_1 a + w_2 b + w_3 c + w_4 d}$$
